Abstract of NZ 573350 (A)

An injection device is disclosed. The injection device comprises a housing to receive a syringe, where the syringe has a discharge nozzle at a first end of the syringe. The syringe is movable between a retracted position in which the discharge nozzle is contained within the housing and an extended position where the discharge nozzle extends from the housing through an exit aperture. A drive acts upon the syringe to advance the syringe from its retracted position to its extended position, and discharge its contents through the discharge nozzle. A syringe carrier, for carrying the syringe as it is advanced, is also provided. The syringe carrier has a first end through which the discharge nozzle extends and a second end opposite the first end. The syringe carrier is adapted to restrict movement of the syringe relative to the syringe carrier in a direction from the first end of the syringe carrier to the second end of the syringe carrier.
